Presentation ITA COSUF 06.12.2023 Digital Twins in the Oil&Gas industry

About VISCO

Founded in 1993

More than 5000 projects

More than 120 employed people

Headquarter in Stavanger (NO)

Offices in Norway, Germany, USA, Poland, Ukraine and Vietnam

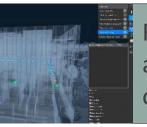

Experienced leader in industrial visualization

Supporting the complete value chain

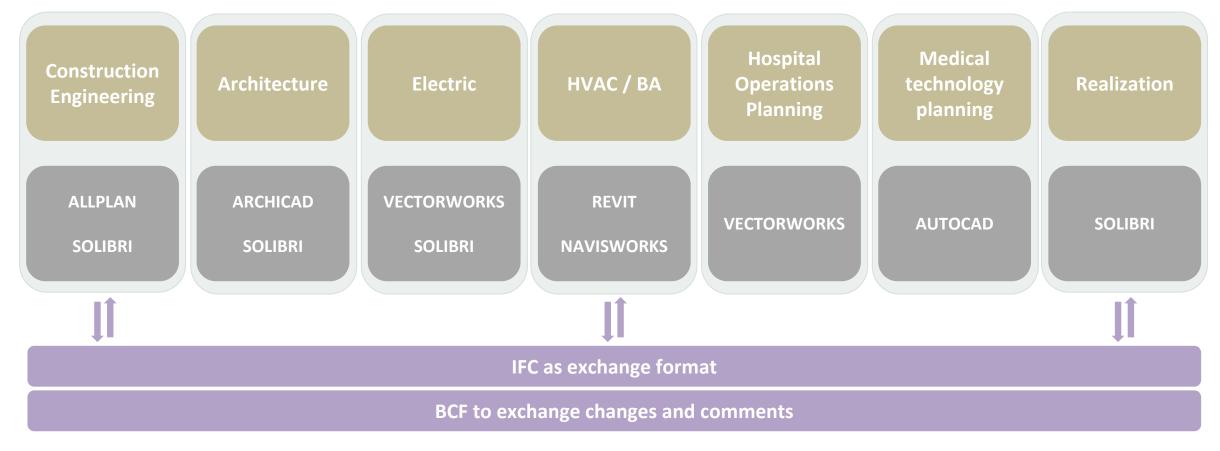

Visualization powered by AI

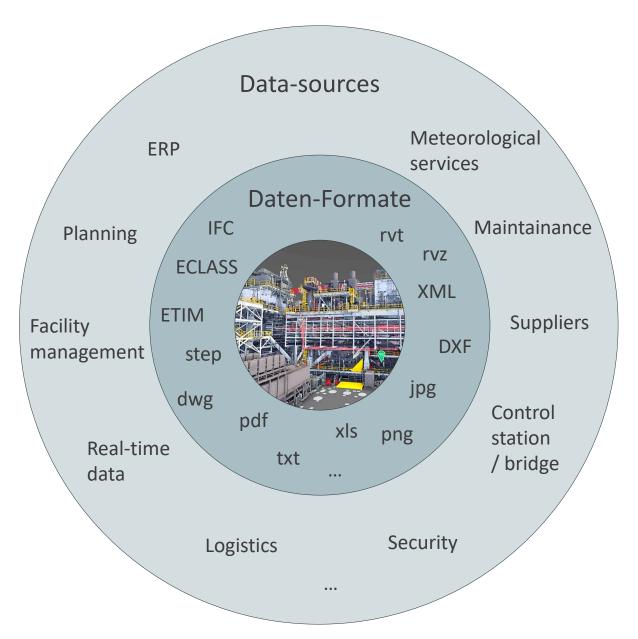

Fit for purpose frontends and user journeys as part of our meta twins

Why open-BIM is so important

Example of the use of IFC as an exchange format between software from different manufacturers in a hospital project

BIM and digital twins in the industry in general

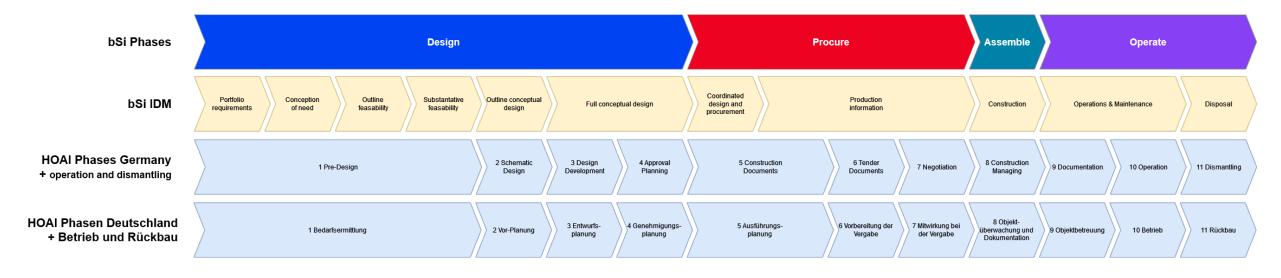

- BIM is making its way into industrial planning step by step. VisCo has been using this data in digital twins for more than a decade now
- The challenge with BIM data is that many BIM models only contain 3D information, which unfortunately has not been enriched with metadata in a standardized way
- This is why open-BIM standardization is so important here as well. It is a rare situation where only a few vendors can agree on a single application.

Planning and construction phases are currently in focus in the BIM process - But BIM is important for the entire life cycle

bSI Phases	bsi iDM	ISO 12006-2	HOAI (Germany)	HOAI (Germany) English	LOD	ÖNORM	2017 Phases	RIBA (UK)	CSI / CSC OmniClass (Canada / USA)	
	Portfolio Requirements	Inception / Procurement		Pre-design	100		Requirements	Strategic Definition	31-10 00 00	Inception Phase
	Conception of Need	Feasibility					Need	Strategic Definition		Conceptualization Phase
Design	Outline Feasibility	Outline Proposals, Programme Preparation	LP1: Grundlagenermittlung				Feasibility	Preparation & Brief	31-20 00 00	
Design	Substantive Feasibility							Concept Design		
	Outline Conceptual Design	Scheme Detail / Costing	LP2: Vorplanung	Schematic Design				Developed Design	31-30 00 00	Criteria Definition Phase
	Full Conceptual Design		LP3: Entwurfsplanung	Design Development	200		Concept			Design Phase
			LP4: Genehmigungsplanung	Approval Planning	300					
	Coordinated Design and procurement	Detail design / costing	LDE: Ausführungenlanung	Construction Documents	400		Coordination		31-40 00 00	Coordination Phase
	Production Information	Production information and Bills of Materials Tender Action	LP5: Ausführungsplanung				Production	Technical Design	31-50 00 00	
Procure			LP6: Vorbereitung der Vergabe	Tender Documents, BOQs						
			LP7: Mitwirkung bei der Vergabe	Negotiations						
	Construction	Construction Preparation	LP8: Objektüberwachung	Construction Managing	500		Construction	Construction	31-60 00 00	Implementation Phase
Assemble		Construction operations on-								
Assemble		site								
		Completion						Handover & Closeout	31-70 00 00	Handover Phase
Operate	Operations & Maintenance		LP9: Objektbetreuung	Documentation, Controlling			0&M	In Use	31-80 00 00	Operations Phase
Operate	Disposal	Feedback	Li 3. Objektbetredding						31-90 00 00	Closure Phase

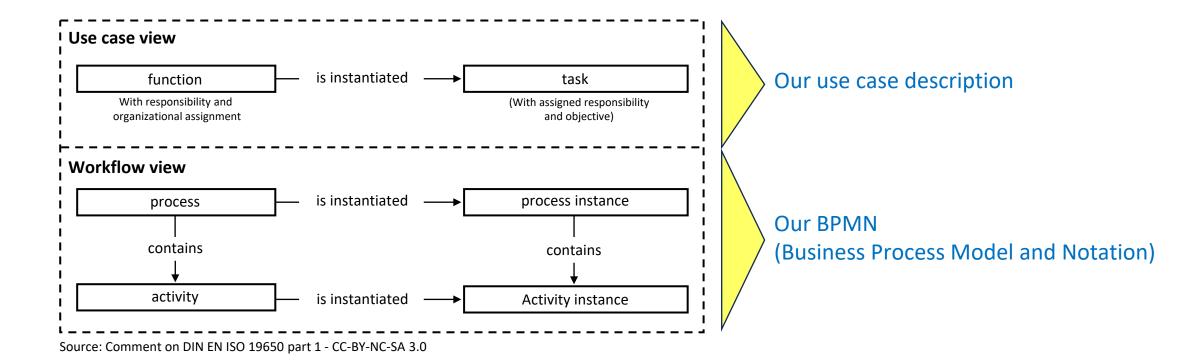

(Source: buildingSMART International / International User Group (Adapted: 2019.05.09))

That's why we adjusted the workflow phases in several buildingSMART working groups

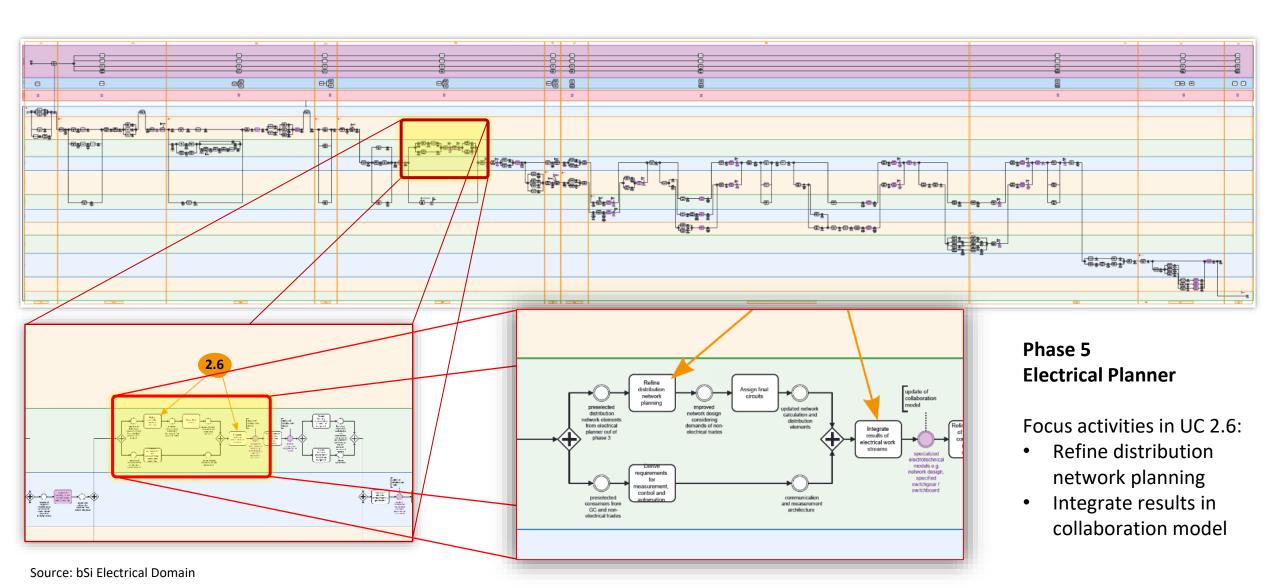

Foundation of Electrical Domain Use Cases - Our primary blueprint is the DIN EN ISO 19650 standard

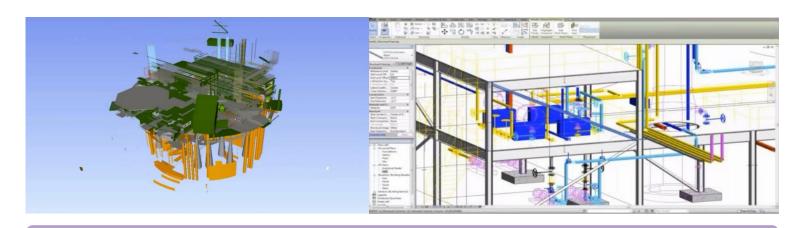

- Blueprint: DIN EN ISO 19650 standard
- BPMN for lifecycle clarity
- Use cases for digestable workflow refinement

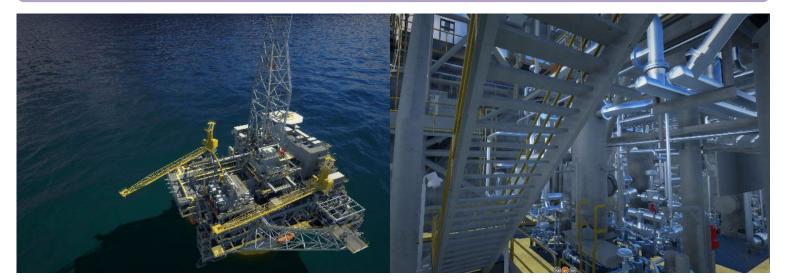

Use Case 2.6 Electrical planner – Location within the overall process

Difference between a CAD environment and a digital twin environment like we use in industry

Incremental rendering vs. full frame rendering

The difference between

- a CAD application,
- · a gaming environment,
- a digital twin
- and an immersive digital twin

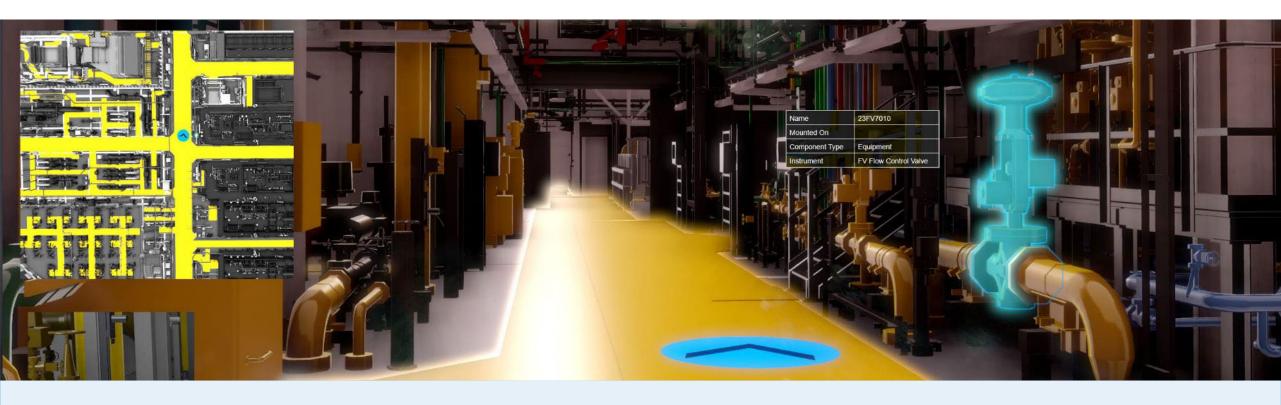

=> they have different application purposes

Digital twins must work in real time for all stakeholders in everyday life

- The difference between a BIM model and its digital twin in operation is that you need to think about day-to-day activities and workflows in addition to change management.
- In addition to designs and sections through various objects, you need to be able to keep track of spare parts handling, risk-based assessments, deck handling, equipment handling, commissioning workflows, asset monitoring, and more.

As-built-models

The as-built model (BIM or not) must be kept alive and constantly aligned with its digital twin.

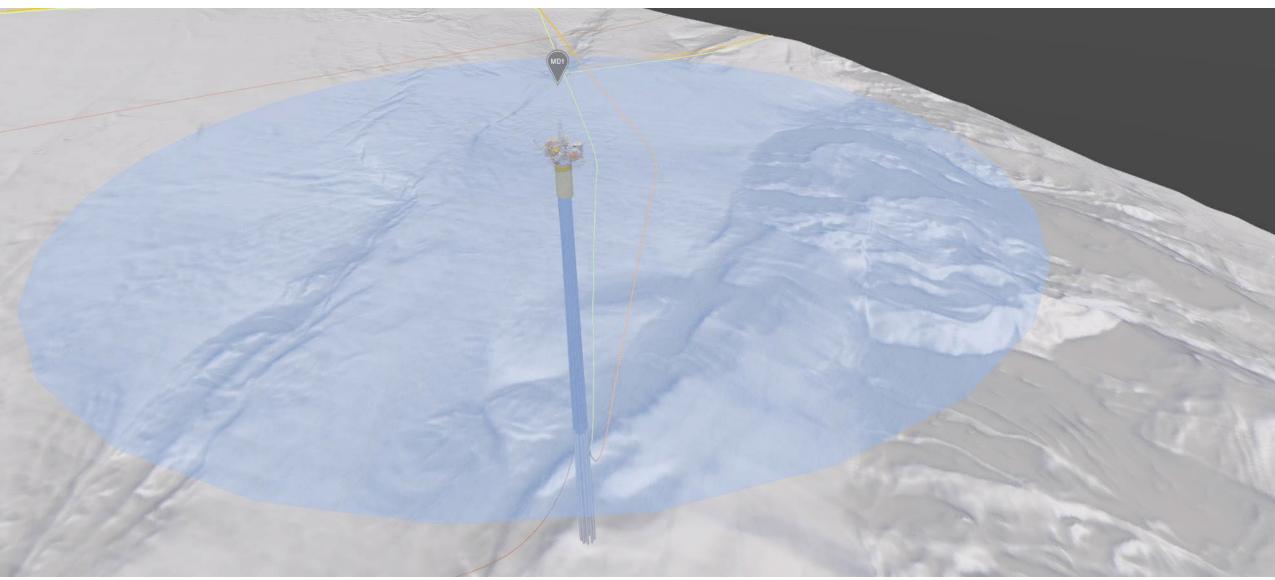

BIM in industrial planning in general

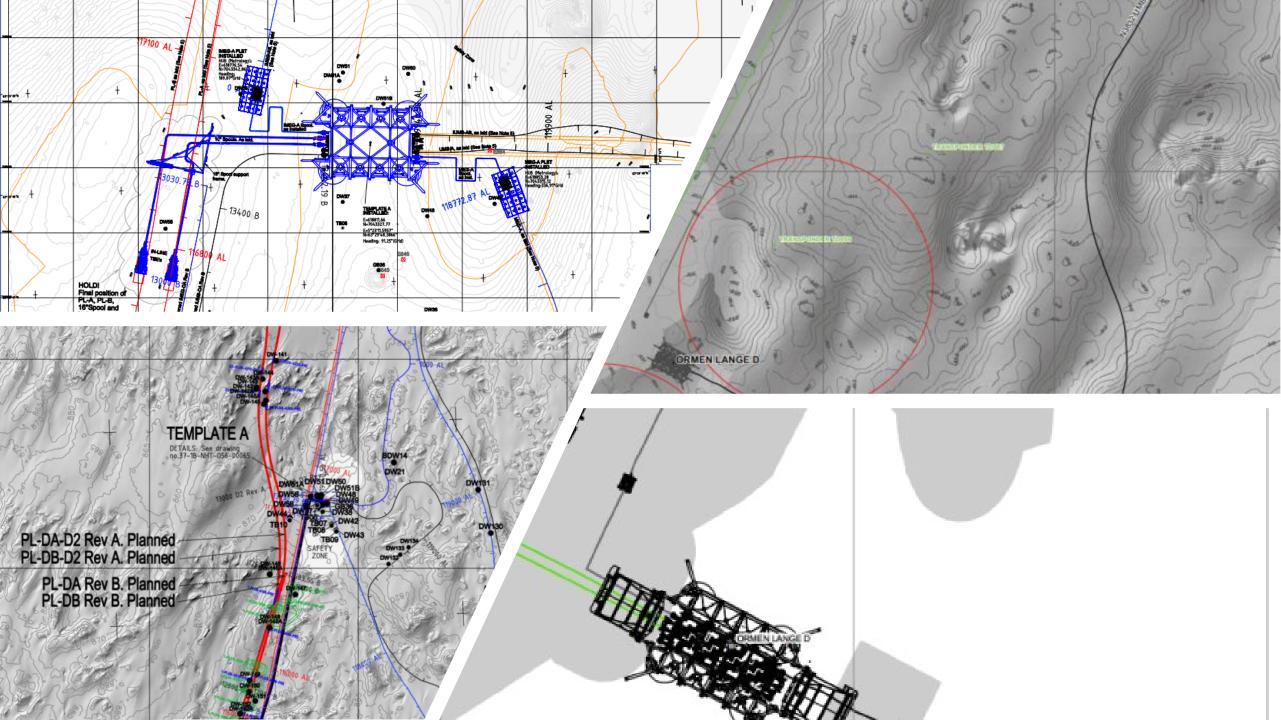

- Standardization will make it increasingly easy to harmonize workflows between different software solutions
- When it comes to digital twins, the challenge reaches a new level as they have to work with live automated systems and interact not only with people but also with machines, e.g. IoT information flows
- Information flows need to go both ways -> forward and backward to enable it on the BIM side to match the as-built model -> of course if there is no as-built model, it is difficult to follow up with updates as changes occur when components need to be replaced

What does this mean for digital twins in practice?

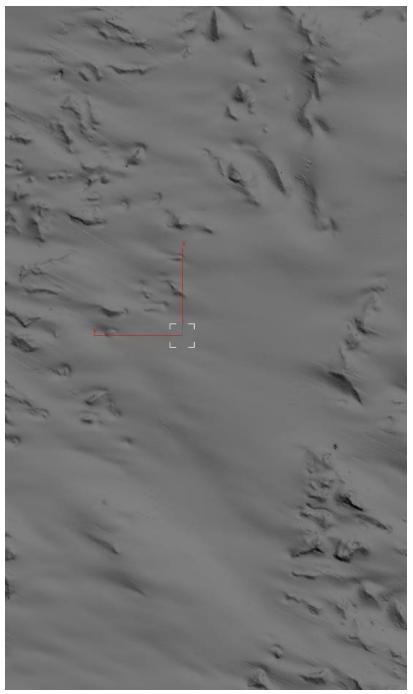

- For example, if you have a model with 6 million objects, they must be present individually
- No limitation in size and accuracy
- Immediate response when searching and filtering (not possible in most CAD environments)
- You need to have a realistic look and feel, because you need to guide people in the field, not in front of their PCs
- Dynamic in real time
- Can be integrated independently from all sources
- Intuitive and easy to use -> fit for purpose -> because after the construction phase, it won't be
 the engineers who use it, but also people on site who have nothing to do with CAD programs. It
 just has to work.
- Because you want to find things and not read tons of manuals

The digital twin must be able to handle GIS in addition to BIM data and other data formats

Inspection points in 3D model

Inspection points presented in an easier to understand way

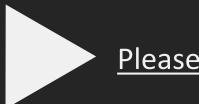

Next step: Immersive collaboration with colleagues

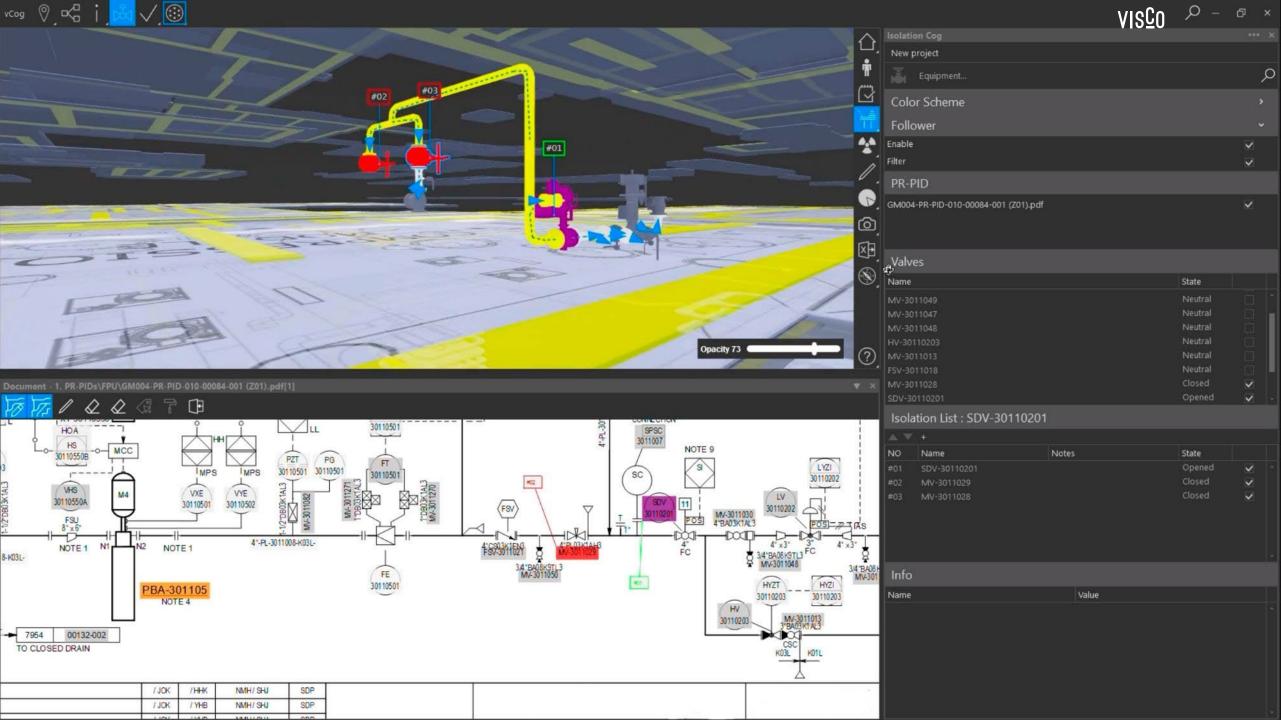

Video link to the Meta Twin solution of visCo

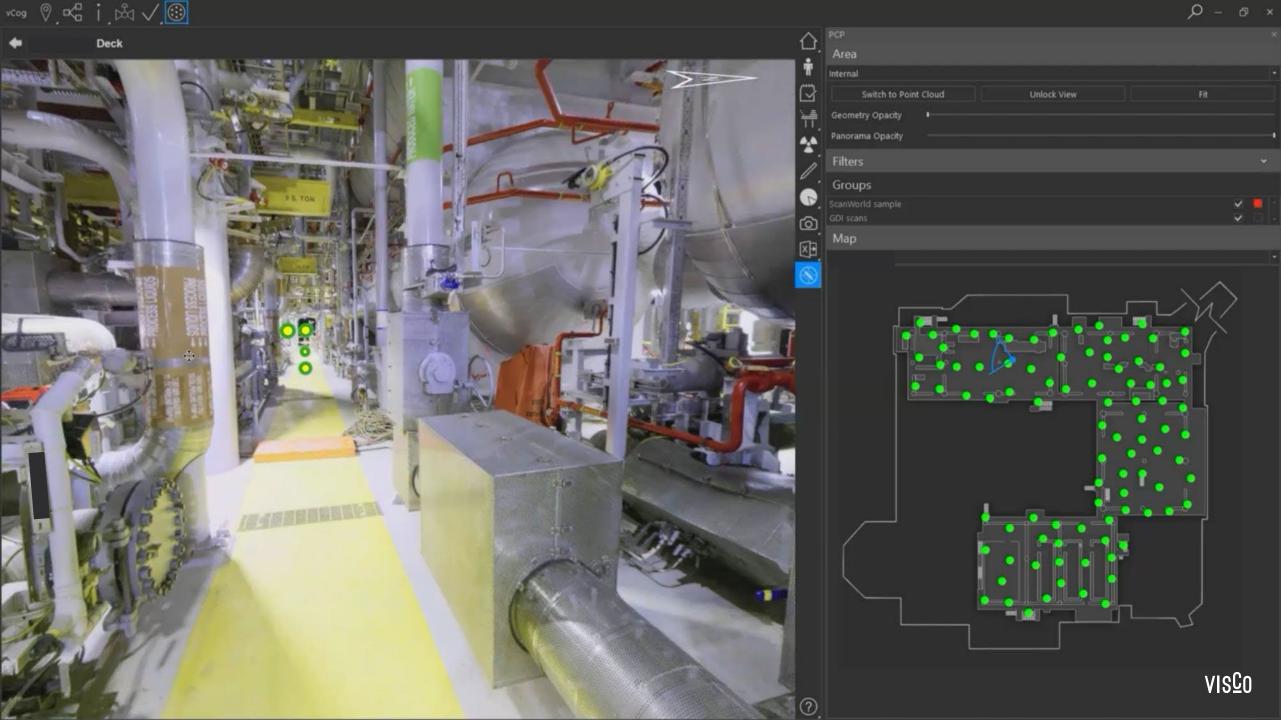

Please click here for the link!

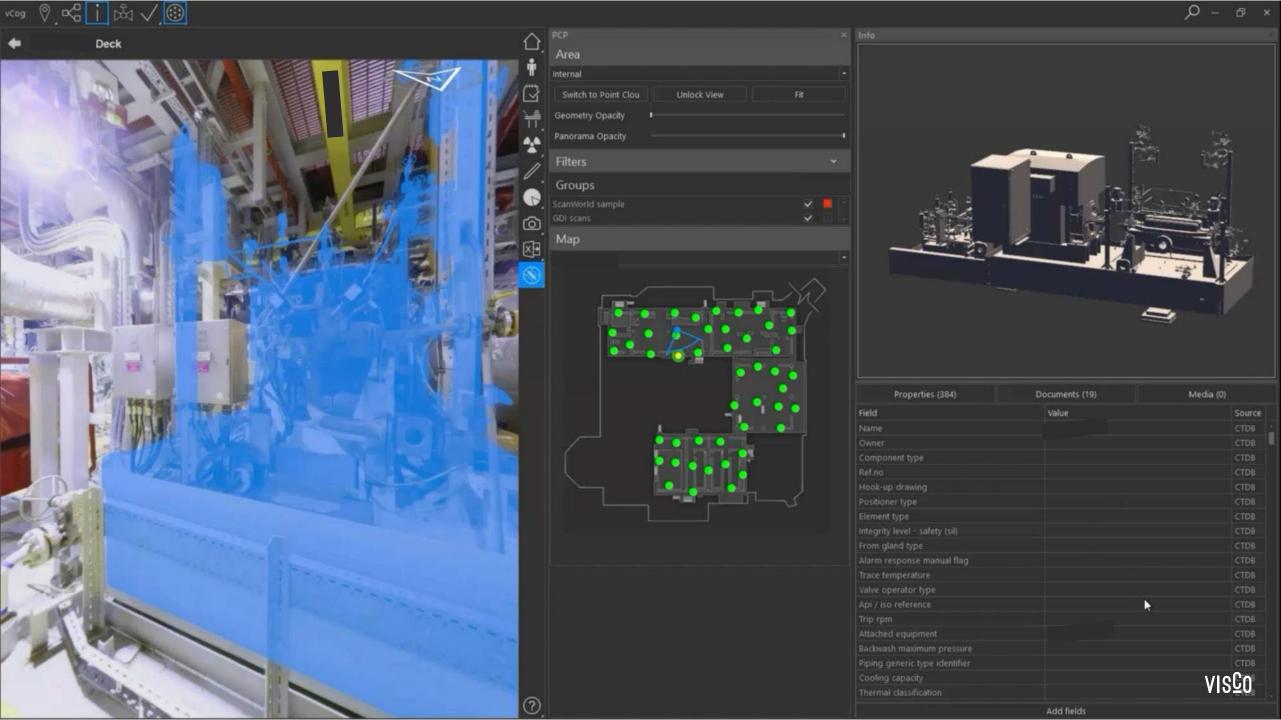

Isolating trades and elements

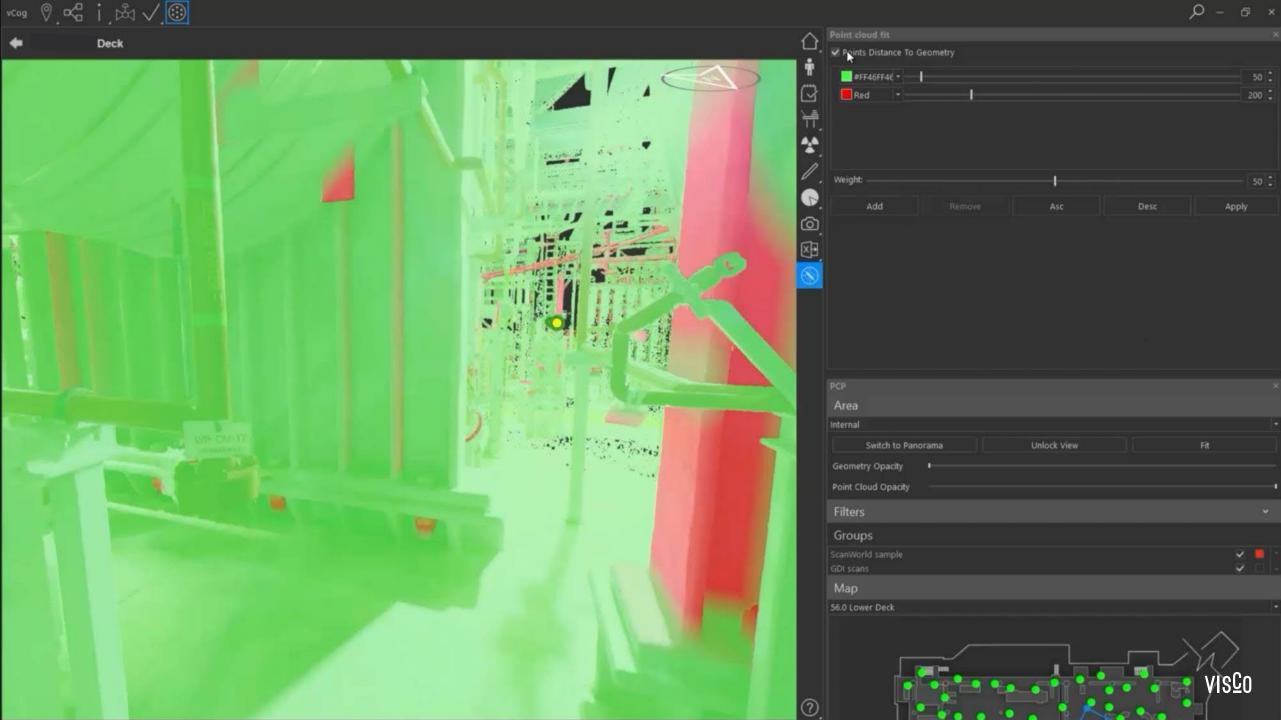

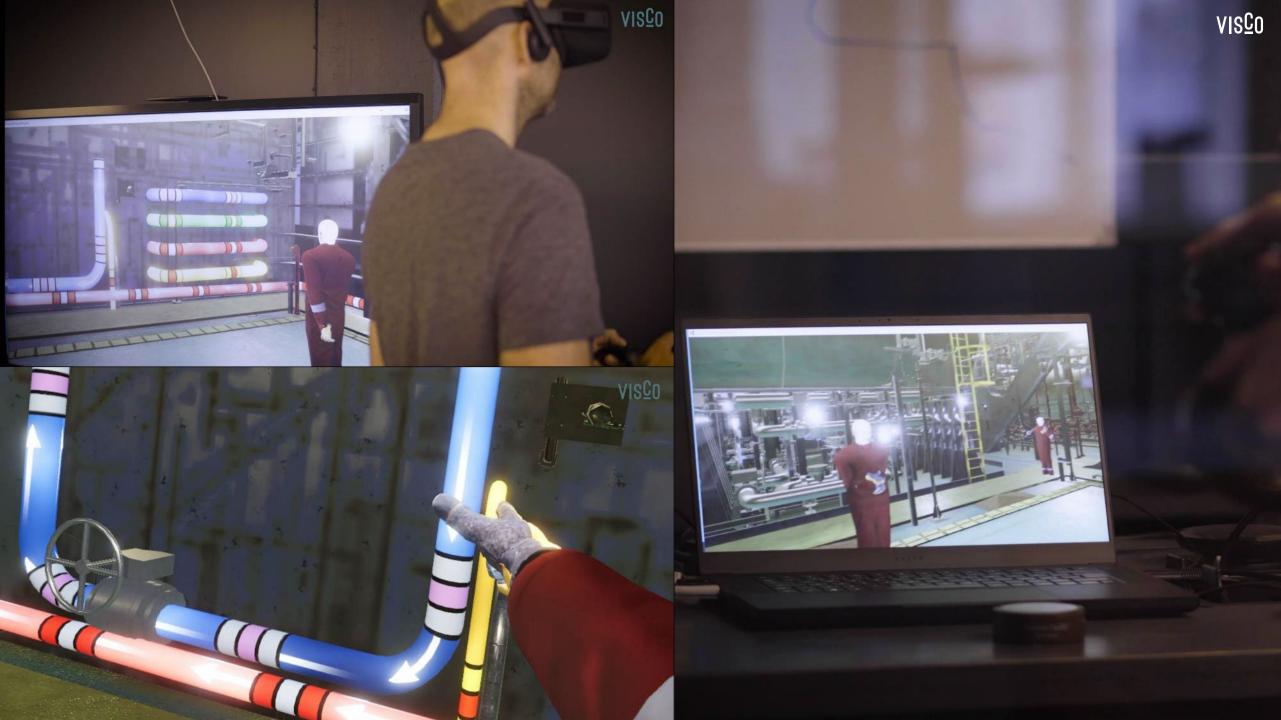

Point cloud and as-built model

Use of avatares for collaboration and training situations with live data

Switching between technical representation and photorealistic representation of a system where you can freely move around

(absolutely fluid visual movements, even in high-end mode, are a necessity for comfortable working)

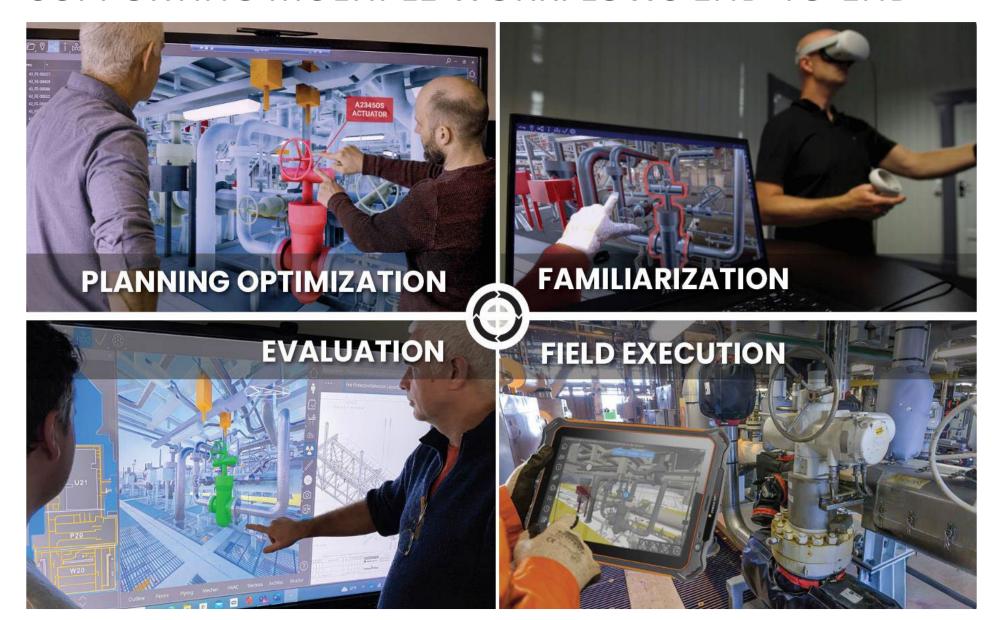

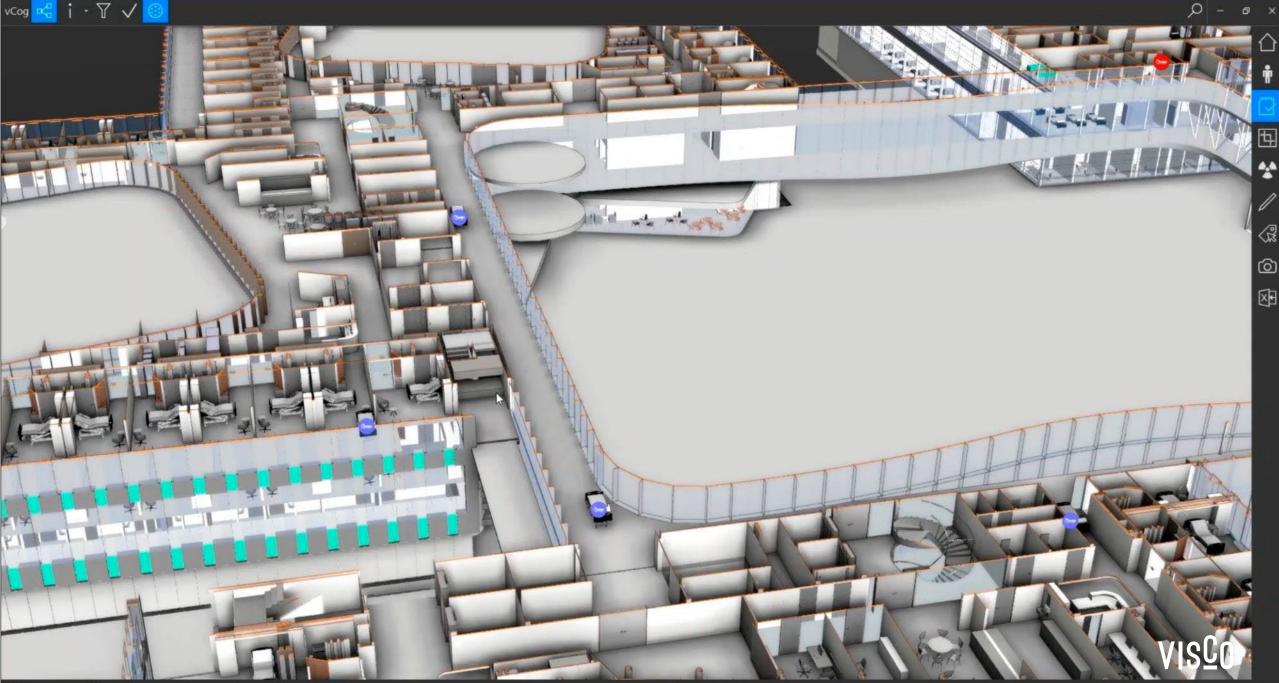

Maintenance

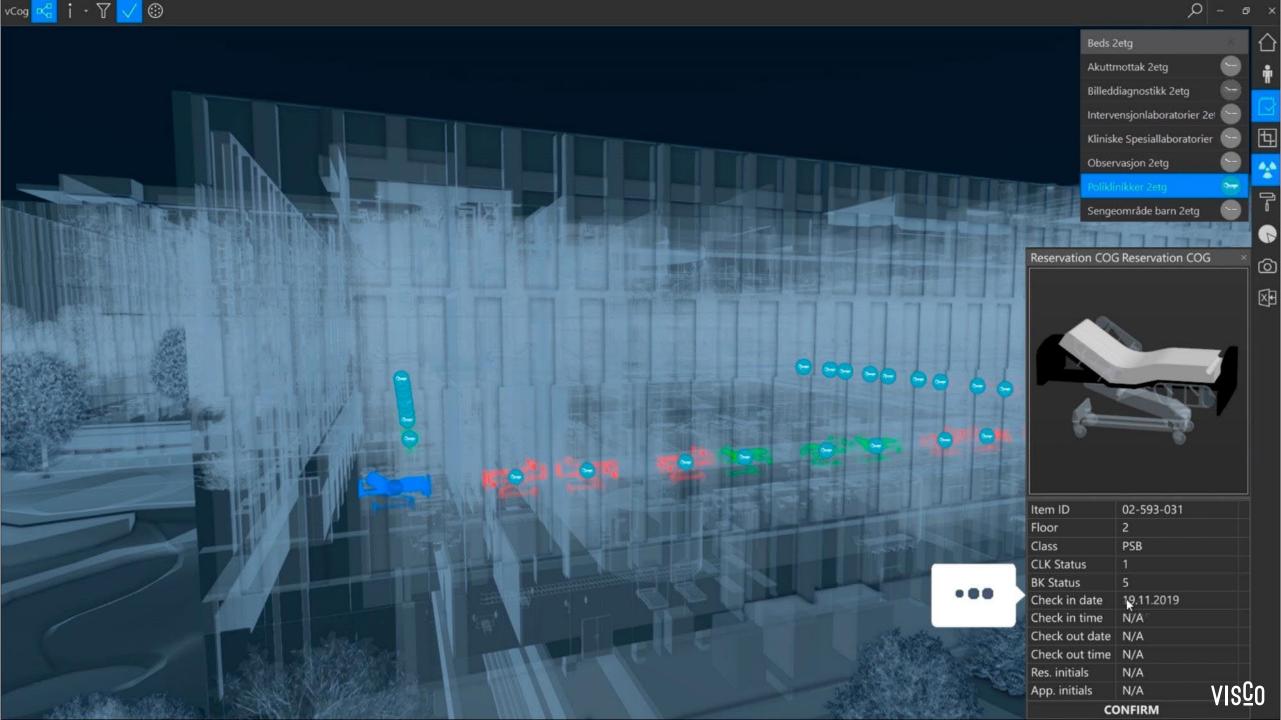

SUPPORTING MULTIPLE WORKFLOWS END-TO-END

Digital Twins in other industries
